

Galaxies

FACT SHEET

A galaxy is a collection of lots of stars. Small galaxies might have around 10 million stars, and large galaxies could have trillions of stars.

The Universe probably contains over 100 billion galaxies - that's over 100,000,000,000 galaxies.

Our galaxy is called 'The Milky Way'.

Galaxies are often found grouped together in 'clusters' of 50 -1000 galaxies.

An elliptical galaxy looks like this.

A spiral galaxy looks like this.

Sometimes galaxies collide and merge to form a bigger galaxy.

Galaxies which look blue in colour have lots of young stars in them.

Galaxies with old stars in them look red in colour.
